

React Hooks Coding Practice Questions

Cognizant / MNC Style Coding Drive — Question Set

Instructions: Solve each question below as a separate React component in a single project. Only React hooks are allowed (no external state libraries). Push your completed code to a GitHub repository and submit the link.

Q1.

Topic: *useState*

Build a counter with +, -, and Reset buttons using a single numeric state.

Q2.

Topic: *useState*

Build an input and Add button. On click, add the entered text to a list and display it.

Q3.

Topic: *useRef + useEffect*

Create a password/login-style input field that is automatically focused when the page loads.

Q4.

Topic: *useEffect*

Fetch a list of users from an API and display each user's name and email.

Q5.

Topic: *useReducer*

Build a counter with Increment by 1, Increment by 5, Decrement by 1, and Reset — managed using *useReducer*.

Q6.

Topic: *Context API*

Create a global Light/Dark theme toggle using Context API, and use it in both a Header and a Dashboard component.

Q7.

Topic: *useState*

Show a list of FAQ questions; when one is clicked, its answer expands, and clicking another closes the previous one.

Q8.

Topic: *useState*

Build a textarea and show a live count of how many characters the user has typed.

Q9.

Topic: *useState*

Create a password input field with a button to show or hide the entered password.

Q10.

Topic: *useRef*

Build a stopwatch with Start and Stop buttons using useRef to store the interval ID.

Q11.

Topic: useEffect

Display the current time as a digital clock that updates every second.

Q12.

Topic: useReducer

Build a Todo app with Add, Delete, and Toggle-Complete functionality, managed using useReducer.

Q13.

Topic: Context API

Build an 'Add to Cart' feature where products are added from a ProductList component and displayed in a separate Cart component using Context API (no prop drilling).

Q14.

Topic: useState

Filter a static list of names based on the text typed into a search input.

Q15.

Topic: useState

Build a form with Name, Email, and Mobile fields, and show the entered data live below the form.

Q16.

Topic: useState

Show a list of products with an 'Add to Cart' button on each, and display the total cart item count.

Q17.

Topic: useRef

Create Home, About, and Contact navigation buttons that smoothly scroll to their respective sections on the page.

Q18.

Topic: useEffect

Display the current browser window width, updating live whenever the window is resized.

Q19.

Topic: useReducer

Manage a login form's Name, Password, and Login status using a single useReducer.

Q20.

Topic: Context API

After logging in, display the logged-in username in a Navbar, Profile, and Home component using a shared Context (no prop drilling).

Q21.

Topic: useState

Build a dropdown to select a department; show a message specific to the selected department below it.

Q22.

Topic: useState

Build a form to enter marks for 5 subjects and display the total and average.

Q23.

Topic: useState

Show a list of tasks, each with a Delete button, and remove only the clicked task from the list.

Q24.

Topic: useRef

Build custom Play and Pause buttons that control an HTML5 video element directly using a ref.

Q25.

Topic: useEffect

Build a search box where the displayed/filtered result updates only 500ms after the user stops typing (debounced search).

Q26.

Topic: useReducer

Manage an app's theme mode and unread notification count together using a single useReducer.

Q27.

Topic: Context API

Create a Context to switch all displayed app text between English and Telugu/Hindi using a language dropdown.

Q28.

Topic: useState

Given 20 items, display only 5 items per page with Next and Previous buttons to paginate.
